Information Supporting NASA HEC WAN File Accessing Experiments/Demonstrations At SC10

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC10

Topics

- Overall objectives
  - Build on last year
- But with significantly updated test matrix
- And with significantly updated:
  - NASA participants
  - NASA partners
  - Vendor loaned equipment
  - NASA-built net-test workstations
  - LAN & WAN test configurations
- Also supporting other demos, e.g., ANL, DICE, LAC & NOAA

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC10

Objectives of NASA HEC WAN File Accessing Experiments

- Determine optimal ‘tuning parameter” settings to obtain maximum user throughput performance with several traditional and new (or emerging) disk-to-disk file-copying utilities when operating over multi-10Gbps WANs using new state-of-the-art high performance workstations and servers
- Inter-compare throughput findings from traditional versus new file-copying utilities
- As a baseline, determine maximum memory-to-memory throughput performance among the workstations and servers using nuttcp (http://www.nuttcp.org/)
- Are an integral part of GSFC/HEC’s 20, 40 & 100 Gbps Network Testbed Plan (http://science.gsfc.nasa.gov/606.1/docs/HECN_10G_Testbeds_082210.pdf)

Optimizing Wide-Area File Transfer for 10-Gbps and Beyond

- Demonstrations of network-performance testing, wide-area file systems, and file transfer applications ranging from traditional to experimental were provided in the NASA research exhibit at the SC09 conference, Portland, OR, Nov. 16–19.

- Jointly planned by GSFC's High End Computer Network Team and NCCS' Advanced Development Team, an indication of the wide-area file transfer applications demonstrated and evaluated is shown in the Data Transfer Test Matrix (top figure) and the WAN infrastructure and servers tested are shown in the configuration diagram (bottom figure).

- Demonstration highlights included over 100 gigabits per second (Gbps) uni-directional memory-to-memory data transmissions between in-booth servers, 40-Gbps bi-directional memory-to-memory data transmissions between servers in-booth and at ARC, 10-Gbps disk-to-disk data transfers between in-booth servers, between servers in-booth and at ARC, and between servers in-booth and at GSFC.

**Commercial product

- Desired measurements: disk-to-disk file-copying-throughput performance (in Gbps), plotted against different file-sizes and different conditions
- Key single-file-sizes in GBs: 16, 32, 64, 128
- Primary different conditions:
  - File-copying-applications, e.g., GridFTP, bbFTP, nuttscp, ...
    - Both well-established and experimental/emerging ones
  - Key round trip times (RTTs) in milliseconds: 0, 15, 90, 180
    - Corresponding very roughly to LAN, large MAN/RON, trans-USA/WAN, trans-Atlantic
- Secondary different conditions, when time permits:
  - Several-file-sizes yet with a constant 256 GB total volume: 16@16, 8@32, 4@64, 2@128
  - Many-file-sizes yet with a constant total volume
  - Cases with packet loss, corruption, etc
  - Real tests
    - @10Gbps: GSFC-GSFC (RTT=0); GSFC-StarLight (RTT=~17); GSFC-ARC (RTT=~87)
    - @20Gbps: GSFC-GSFC; GSFC-StarLight
    - @40Gbps: GSFC-GSFC; GSFC-SC10 (RTT=~35)

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC10

Elaboration of Test Matrix for Optimizing Large File Transfers Over Wide Areas (1 of 2)

- Desired measurements (y-axis): disk-to-disk file-copying-throughput performance (in Gbps), plotted against different file-sizes and different conditions
- Key single-file-sizes in GBs: 16, 32, 64, 128
- Primary different conditions:
  - File-copying-applications, e.g., GridFTP, bbFTP, nuttscp, …
    - Both well-established and experimental/emerging ones
  - Key round trip times (RTTs) in milliseconds: 0, 15, 90, 180
    - Corresponding very roughly to LAN, large MAN/RON, trans-USA/WAN, trans-Atlantic

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC10

Elaboration of Test Matrix for Optimizing Large File Transfers Over Wide Areas (2 of 2)

- Secondary different conditions, when time permits:
  - Several-file-sizes yet with a constant 256 GB total volume: 16@16, 8@32, 4@64, 2@128
  - Many-file-sizes yet with a constant total volume, e.g., a single directory of small-to-medium-to-partly-large size files
  - Cases with packet loss, corruption, etc, particularly if they can be controlled by netem and “be realistic”
  - Real tests near-term
    - @10Gbps: GSFC-GSFC (RTT=0); GSFC-StarLight (RTT=~17); GSFC-ARC (RTT=~87)
    - @20Gbps: GSFC-GSFC; GSFC-StarLight
  - Real tests very soon
    - @40Gbps: GSFC-GSFC; GSFC-SC10 (RTT=~35)

Identification of GSFC/HECN Equipment Used

- A+ net-test workstations*: see following pages
- Arista: 7124S & 7148SX 10GE switches
- B net-test workstations*: see following pages
- C net-test workstations*: see following pages
- Extreme Networks: Summit X650 10GE switches
- Force10: E600i & S2410P 10GE switches
- XSSD, XSSD++ net-test workstations*: see following pages

*Advanced hint: A, B & C's are Intel Core i7-based; XSSD's are Intel Xeon-based

100 Gigabits per Second Transmissions Achieved Via A Single Workstation

- As part of plans to assess the throughput performance of wide-area file transfer applications, GSFC's High End Computer Network (HECN) Team specified and assembled a workstation that costs less than $11,000 and is capable of over 100 gigabits per second (Gbps) data transmission – 10 times the transmission speed of most high end computers.

- The workstation consists of a 3.2-GHz dual-processor (quad core) Intel Xeon W5580 (Nehalem) with six Myricom dual-port 10-Gigabit Ethernet network interface cards in the PCIe Gen2 slots of a Supermicro X8DAH+-F motherboard.

- Over 100-Gbps aggregate-throughput transmissions from the Xeon-workstation to two Intel Core i7 workstations (also specified and assembled by the HECN Team) were measured using the nuttcp (www.nuttcp.net) network-performance testing tool.

- Demonstrations of these workstations supporting network-performance testing, wide-area file systems, and file transfer applications ranging from traditional to experimental are planned in the NASA research exhibit at the SC09 conference, Portland, OR, Nov. 16–19 .

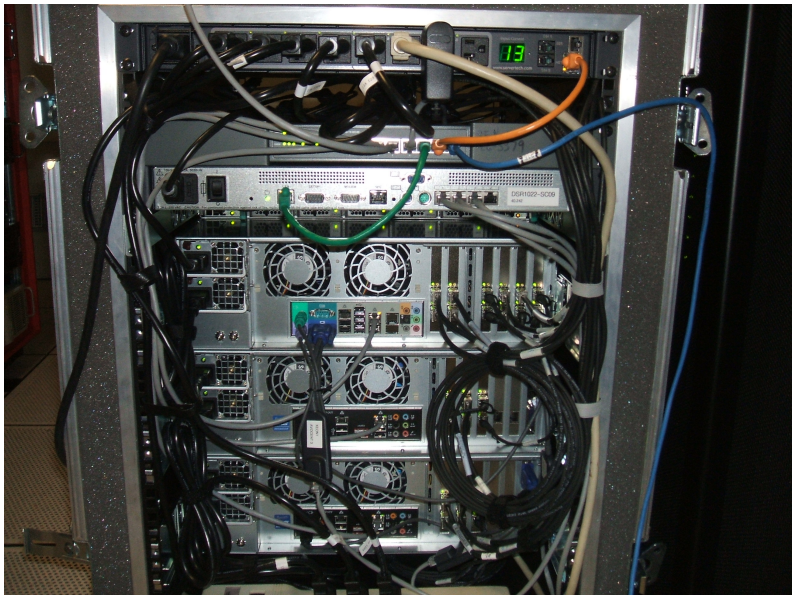

Figure: Xeon and two Core i7 workstations (bottom) interconnected with 10 Gigabit Ethernet switch and management units (top) in a rack for shipping to SC09.

POC: Bill Fink, William.E.Fink@nasa.gov, (301) 286-7924, GSFC Computational and Information Sciences and Technology Office

10-Gbps Disk-to-Disk File Copies Achieved Via Workstations Costing Less Than $7,000

- As part of plans to assess the throughput performance of wide-area file transfer applications, GSFC's High End Computer Network Team specified and assembled workstations that individually costs less than $7,000 and are capable of over 10 gigabits per second (Gbps) disk-to-disk file copying.
- Each workstation consists of a 3.2-GHz single-processor (quad core) Intel Core i7 (Nehalem) with two HighPoint RocketRaid 4320 RAID disk controllers and a Myricom 10 Gigabit Ethernet network interface card in the PCIe Gen2 slots of a Asus P6T6 WS Revolution motherboard. Each RAID controller hosts eight Western Digital WD5001AALS 500-gigabyte disks.
- Over 10-Gbps disk-to-disk file-copying throughput between two of the workstations was measured using the nuttscp (www.nuttcp.net) file copying tool.
- Demonstrations of these workstations supporting network-performance testing, wide-area file systems, and file transfer applications ranging from traditional to experimental are planned in the NASA research exhibit at the SC09 conference, Portland, OR, November 16–19 .

***Figure*:** Two Core i7 workstations interconnected via 10 Gigabit Ethernet in test configuration prior to shipping to SC09.

POC: Bill Fink, William.E.Fink@nasa.gov, (301) 286-7924, GSFC Computational and Information Sciences and Technology Office

17.8-Gbps Disk-to-Disk File Copies Achieved Via Workstations Costing Less Than $9,000

- As part of plans to assess the throughput performance of wide-area file transfer applications, GSFC's High End Computer Network Team specified and assembled workstations that individually costs less than $9,000 and are capable of over 17.8 gigabits per second (Gbps) disk-to-disk file copying.
- Each workstation consists of a 3.2-GHz single-processor (quad core) Intel Core i7 (Nehalem) with four HighPoint RocketRaid 4320 RAID disk controllers and a Myricom 2-port 10 Gigabit Ethernet network interface card in the PCIe Gen2 slots of a Asus P6T6 WS Revolution motherboard. Each RAID controller hosts eight Western Digital WD5001AALS 500-gigabyte disks.
- Over 17.8-Gbps disk-to-disk file-copying throughput between two of the workstations was measured using the nuttscp (www.nuttcp.net) file copying tool.
- While SSD technology is next to be investigated, parallelism of multiple cores and multiple streams is likely to be key to going to 40-Gbps and beyond, since individual cores are not getting significantly faster.

***Figure*:** Right case houses Core i7 cores, DDR3 memory, NIC, two "internal" controllers each with eight disks and two "external" controllers; left case houses sixteen SAS-connected disks.

POC: Bill Fink, William.E.Fink@nasa.gov, (301) 286-7924, GSFC Computational and Information Sciences and Technology Office

Aggregate 55+ Gigabits per Second (Gbps) Transmits, 52+ Gbps Receives and 75+ Gbps Bi-Directional Transmissions Achieved Via A Single Workstation With a Single 6x10-Gigabit Ethernet Network Interface Card

- As part of plans to assess the throughput performance of wide-area file transfer applications, GSFC's High End Computer Network (HECN) Team tested a HotLava six-port 10-Gigabit Ethernet network interface card (NIC) in a HECN Team-assembled workstation that costs less than $ 6,800 with the NIC and achieved aggregate 55+ Gbps transmits, 52+ Gbps receives and 75+ Gbps bi-directional memory-to-memory data transmissions.

- The workstation consists of a 3.2-GHz single-processor (quad core) Intel Core i7 (Nehalem) with one HotLava NIC in one PCIe Gen2 x16 slot of an Asus P6T6 WS Revolution motherboard.

- Transmissions between the above workstation and two other HECN Team-assembled Intel Core i7 workstations with other NICs were measured using the nuttcp (www.nuttcp.net) network-performance testing tool.

- Demonstrations of similar workstations supporting 100 Gbps network testing and near-40 Gbps file transfer applications are planned in the NASA research exhibit at the SC10 conference, New Orleans, LA, Nov. 15–18.

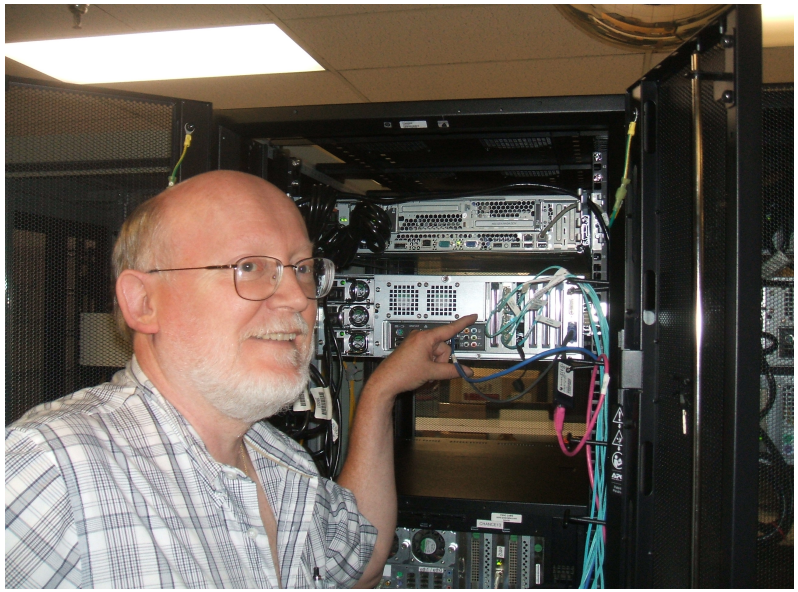

***Figure*:** Bill Fink, author of nuttcp and the throughput performance tests, pointing to the 6x10GE HotLava NIC in the HECN Team's Intel Core i7 based workstation.

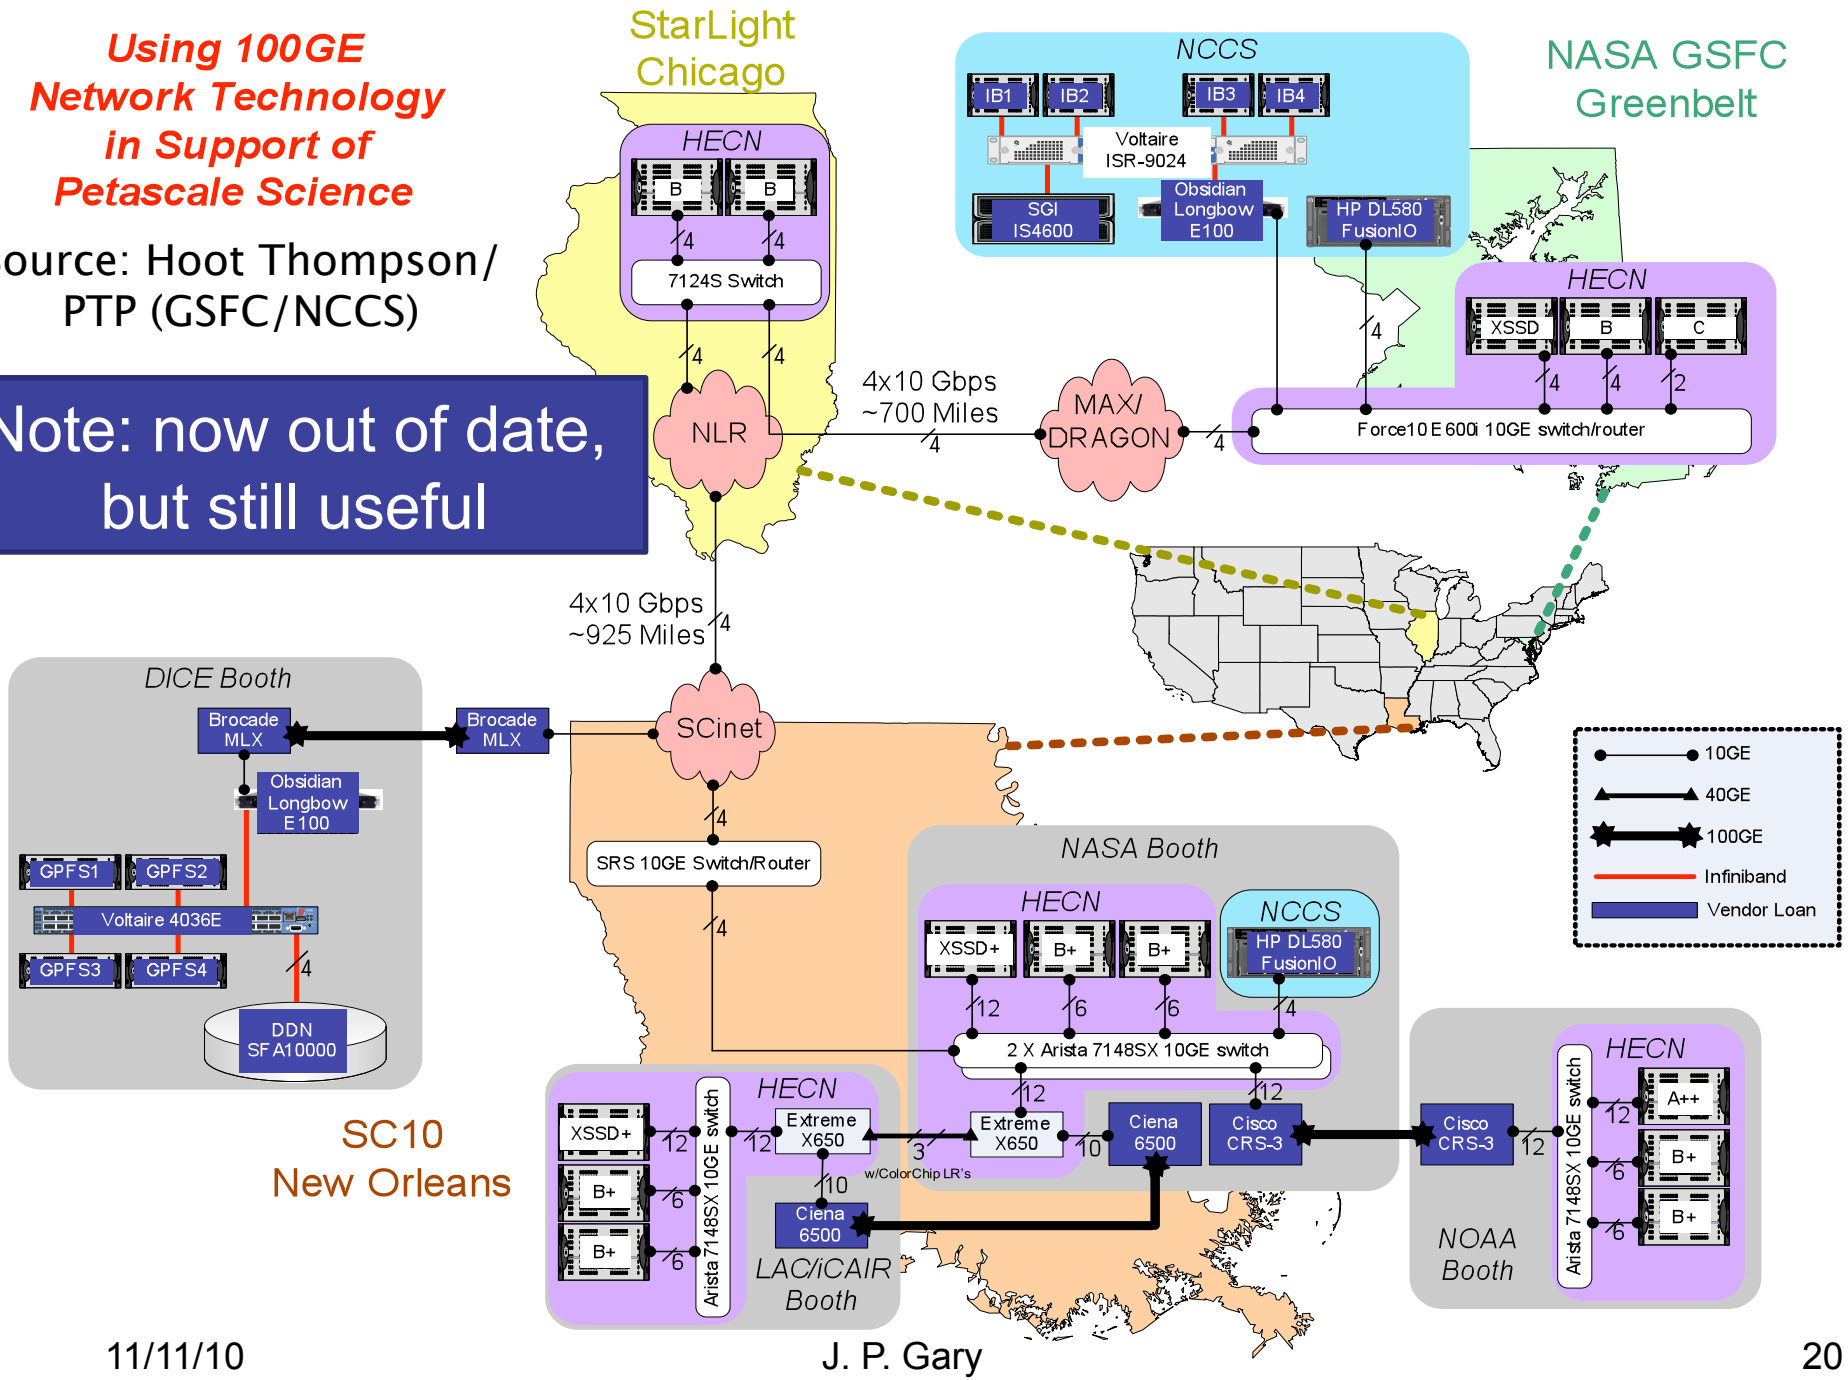
Using 100GE Network Technology in Support of Petascale Science

Source: Hoot Thompson/ PTP (GSFC/NCCS)

Note: now out of date, but still useful



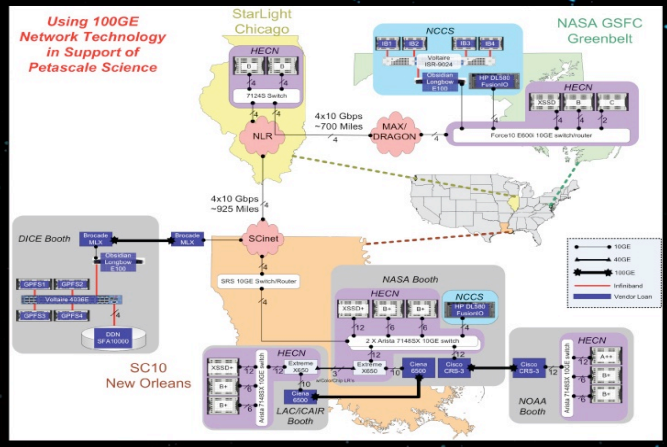
Network Testbed for Enhanced Earth Science Simulations

NASA Earth science models are generating more than 120 terabytes per month in wide-area network transfers. With geographically distributed systems, it is vital to provide highly optimized, high-end network services to store, share, and analyze large amounts of data.

To improve data movement and management for this research, a testbed of advanced hardware and software technologies has been installed between the NASA Center for Climate Simulation (NCCS) at Goddard Space Flight Center and the StarLight facility in Chicago. During SC10, this testbed has been extended to the exhibits of the University of Illinois at Chicago's Laboratory for Advanced Computing, the National Oceanic and Atmospheric Administration, and NASA.

- The testbed utilizes 10-gigabit-per-second through 100-gigabit-per-second technologies including national research and development (R&D) networks
- Wide-area issues are addressed through a suite of tests ranging from experimental wire-speed tests, traditional and emerging file transfer applications, and file systems

The successes of this testbed will allow scientists, particularly those engaged in climate research sponsored by NASA's Science Mission Directorate, to focus on their missions rather than on day-to-day tasks associated with data management.



Major components and partners supporting the NASA Center for Climate Simulation's high-performance file transfers over wide-area network testbeds and different approaches to 100 gigabit-per-second networking. *Pat Gary, NASA/Goddard*

Test Matrix for Optimizing Wide-Area File Transfers

- Desired measurements: disk-to-disk file-copying-throughput performance (in Gbps), plotted against different file-sizes and different conditions
- Key single-file-sizes in gigabytes (GB): 16, 32, 64, 128
- Primary test conditions:
  - File-copying-applications, e.g. GridFTP, bbFTP, & nuttscp
    - Both well established and experimental/emerging
  - Key roundtrip times (RTTs) in ms: 0, 15, 90, 180
    - Corresponds roughly to LAN, large MAN/RON, trans-USA/WAN, trans-Atlantic
- Secondary test conditions, when time permits:
  - Several-file-sizes yet with a constant 256 GB total volume: 16x16GB, 8x32GB, 4x64GB, 2x128GB
  - Many-file-sizes yet with a constant volume
  - Cases with packet loss, corruption, etc.
  - Real tests at various RTT
    - @ 10Gbps: GSFC-GSFC, GSFC-StarLight, GSFC-ARC
    - @ 20Gbps: GSFC-GSFC, GSFC-StarLight
    - @ 40Gbps: GSFC-GSFC, GSFC-SC10

SUPERCOMPUTING

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC10

Special SC10 Demonstration/Evaluation Experiments

- NASA in collaboration with a set of partners will be conducting a set of individual experiments and demonstrations that collectively are titled "**Using 100G Network Technology in Support of Petascale Science**". The partners include the iCAIR, Internet2, LAC, MAX, NLR, NOAA and SRS as well as the vendors Ciena, Cisco, ColorChip, cPacket, Extreme Networks, Fusion-io, HP and Panduit who most generously are allowing some of their leading edge 40G/100G network and file server technologies to be involved. The experiments and demonstrations will feature different approaches to full-duplex 40G/100G networking across the SRS infrastructure between the NCDM-LAC/ iCAIR, NASA and NOAA exhibit booths load-stressed by sets of NASA/HECN-built, relatively inexpensive, net-test-workstations that are capable of demonstrating >100Gbps uni-directional nuttcp-enabled memory-to-memory data flows, 80-Gbps aggregate-bidirectional memory-to-memory data transfers, and near 40-Gbps uni-directional disk-to-disk data copies as well as ones between SC10 and StarLight+GSFC across 8x10Gbps network pathways enabled by the NLR and a 1x100 network pathway enabled by the Internet2.

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC10

Special SC10 Demonstration/Evaluation Experiments

- Use a set of the NASA/HECN Team's network-testing-workstations deployed into both the NCDM-LAC/iCAIR and NASA Exhibit Booths, capable of:
  - >100G uni-directional memory-to-memory data flows
  - >80G aggregate-bidirectional memory-to-memory data flows
  - ~40G uni-directional disk-to-disk file copies (using SSDs)
- Demonstrate/evaluate different vendor-provided 40G/100G network technology solutions with full-duplex 40G and 100G LAN data flows across SCinet Research Sandbox inter-booth fiber
- Use existing 4x10G dedicated pathway across NLR and MAX/ DRAGON between GSFC and StarLight, plus a mix of 8 other 10G NLR+Cisco-provisioned pathways and a 1x100G Internet2-provisioned pathway between StarLight and SC10, to conduct science-oriented WAN data flow demonstrations

Using 100G Network Technology in Support of Petascale Science

A Collaborative Initiative Among NASA, NLR, NOAA, Northwestern/iCAIR, SCinet & UIC/LAC
Also Using Internet2's Multi-Vendor 100GigE Infrastructure Between StarLight and SC10

Demo Summary

12x10Gbps* between: HECN XSSD++ + HECN A+ + HECN A+ ⟷ HECN XSSD++ + HECN A+ + HECN A+

1x40Gbps full-duplex across: Extreme X650 ⟷ Extreme X650 (w/ColorChip LR's)

1x100Gbps full-duplex across: Ciena 6500 ⟷ Ciena 6500

1x100Gbps full-duplex across: Cisco CRS-3 ⟷ Cisco CRS-3 ⟷ Cisco CRS-3

1x100Gbps full-duplex across: Juniper T1600 ⟷ Internet2 ⟷ Juniper T1600

8x10Gbps full-duplex across: Wksts @SC10 ⟷ NLR ⟷ Wksts @StarLight

40Gbps disk-to-disk between: HECN XSSD++ ⟷ HECN XSSD++

40Gbps disk-to-disk across: XSSD++ @SC10 ⟷ Internet2 + NLR + MAX/DRAGON ⟷ XSSD @GSFC

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC10

Demo Configuration Factoids

- Connections to the respective booths from the other booths:
  - NASA: equivalent to 48x10GE
  - NCDM: equivalent to 22x10GE
  - NOAA: equivalent to 22x10GE
  - SCinet: equivalent to 40x10GE
  - **Total: equivalent to 132x10GE**, but (after some barrel connections) only **needed 36 fiber-pairs** (not 66) as the four fiber-pairs carrying 40G and/or 100G handle the equivalent of 34x10GE
- Intra-booth 10GE ports used:
  - NASA: 154 (note: cPacket really uses 24)
  - NCDM: 108
  - NOAA: 36 (note: cPacket really uses 24)
  - SCinet: 20
  - **Total: 318**

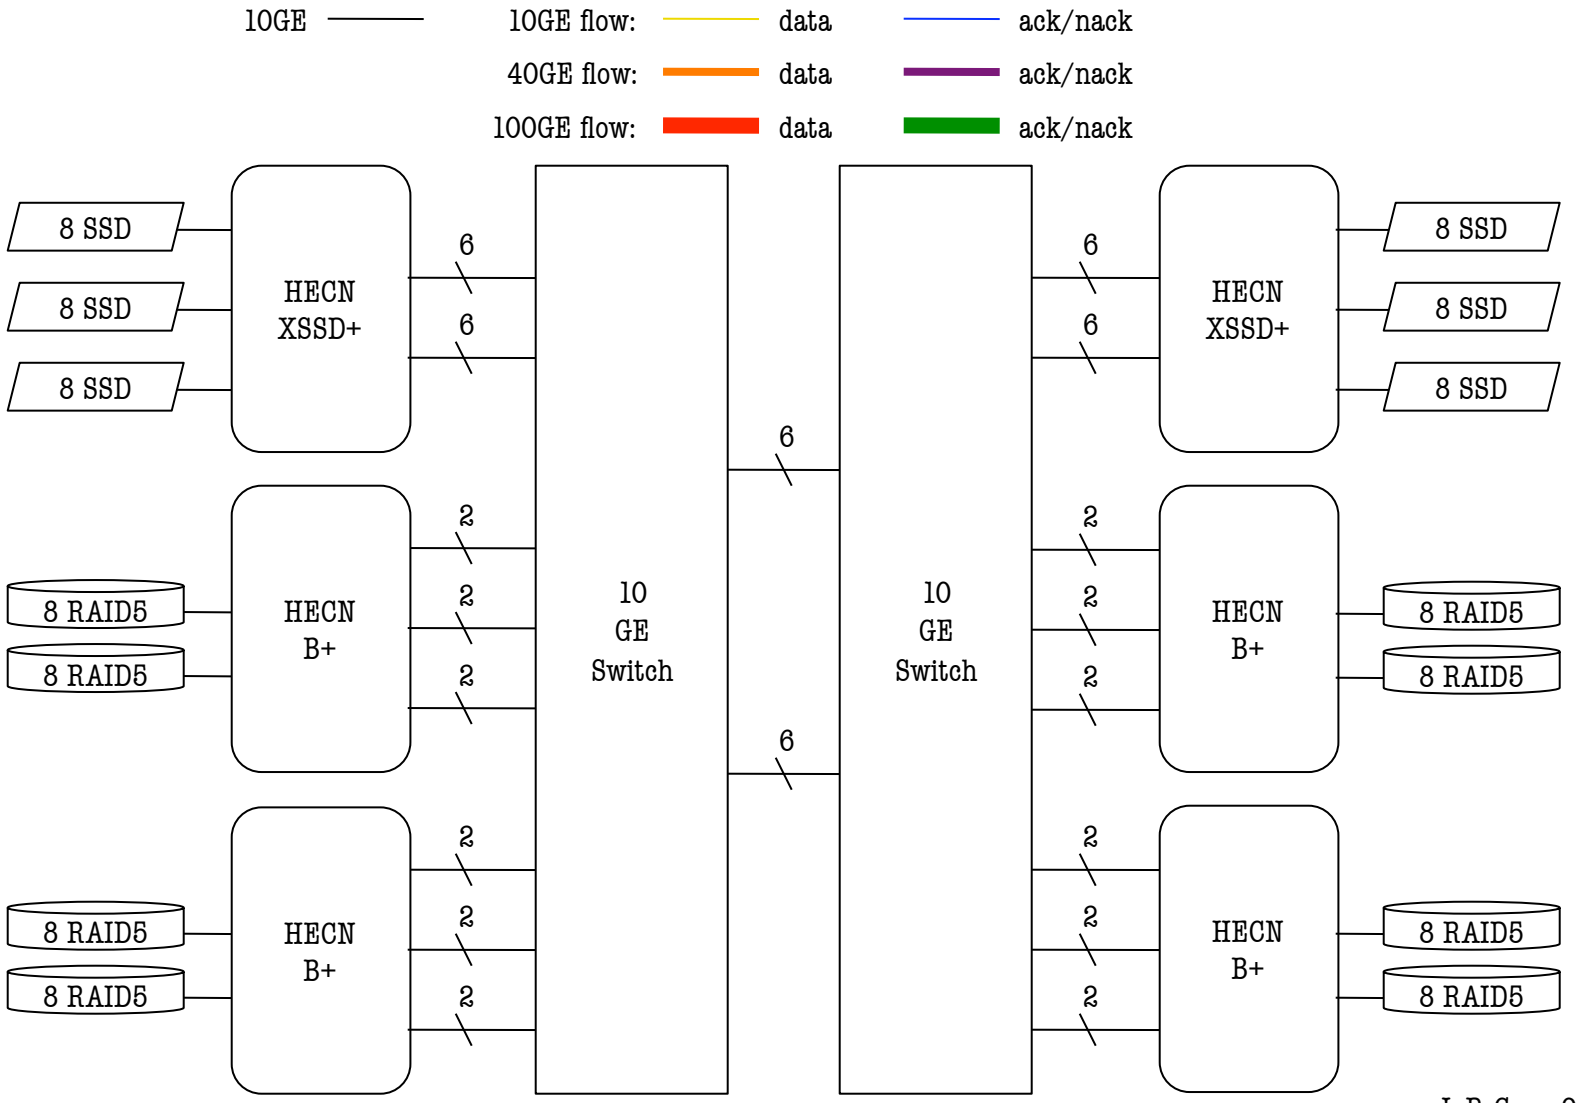
Nuttcp >100 Gbps Uni-Directional Memory-to-Memory Flow Paths

- Receive limitations in HECN's Xeon workstations cause use of two Core i7 workstations to support >100 Gbps uni-directional memory-to-memory data transmissions from one Xeon transmitter

- Bi-directionally filling an intervening network with 100G data flows requires only two sets each consisting of one Xeon transmitter and two Core i7 receivers

Nuttcp >100 Gbps Uni-Directional Memory-to-Memory Flow Paths (1 of 9)



Nuttcp >100 Gbps Uni-Directional Memory-to-Memory Flow Paths (2 of 9)

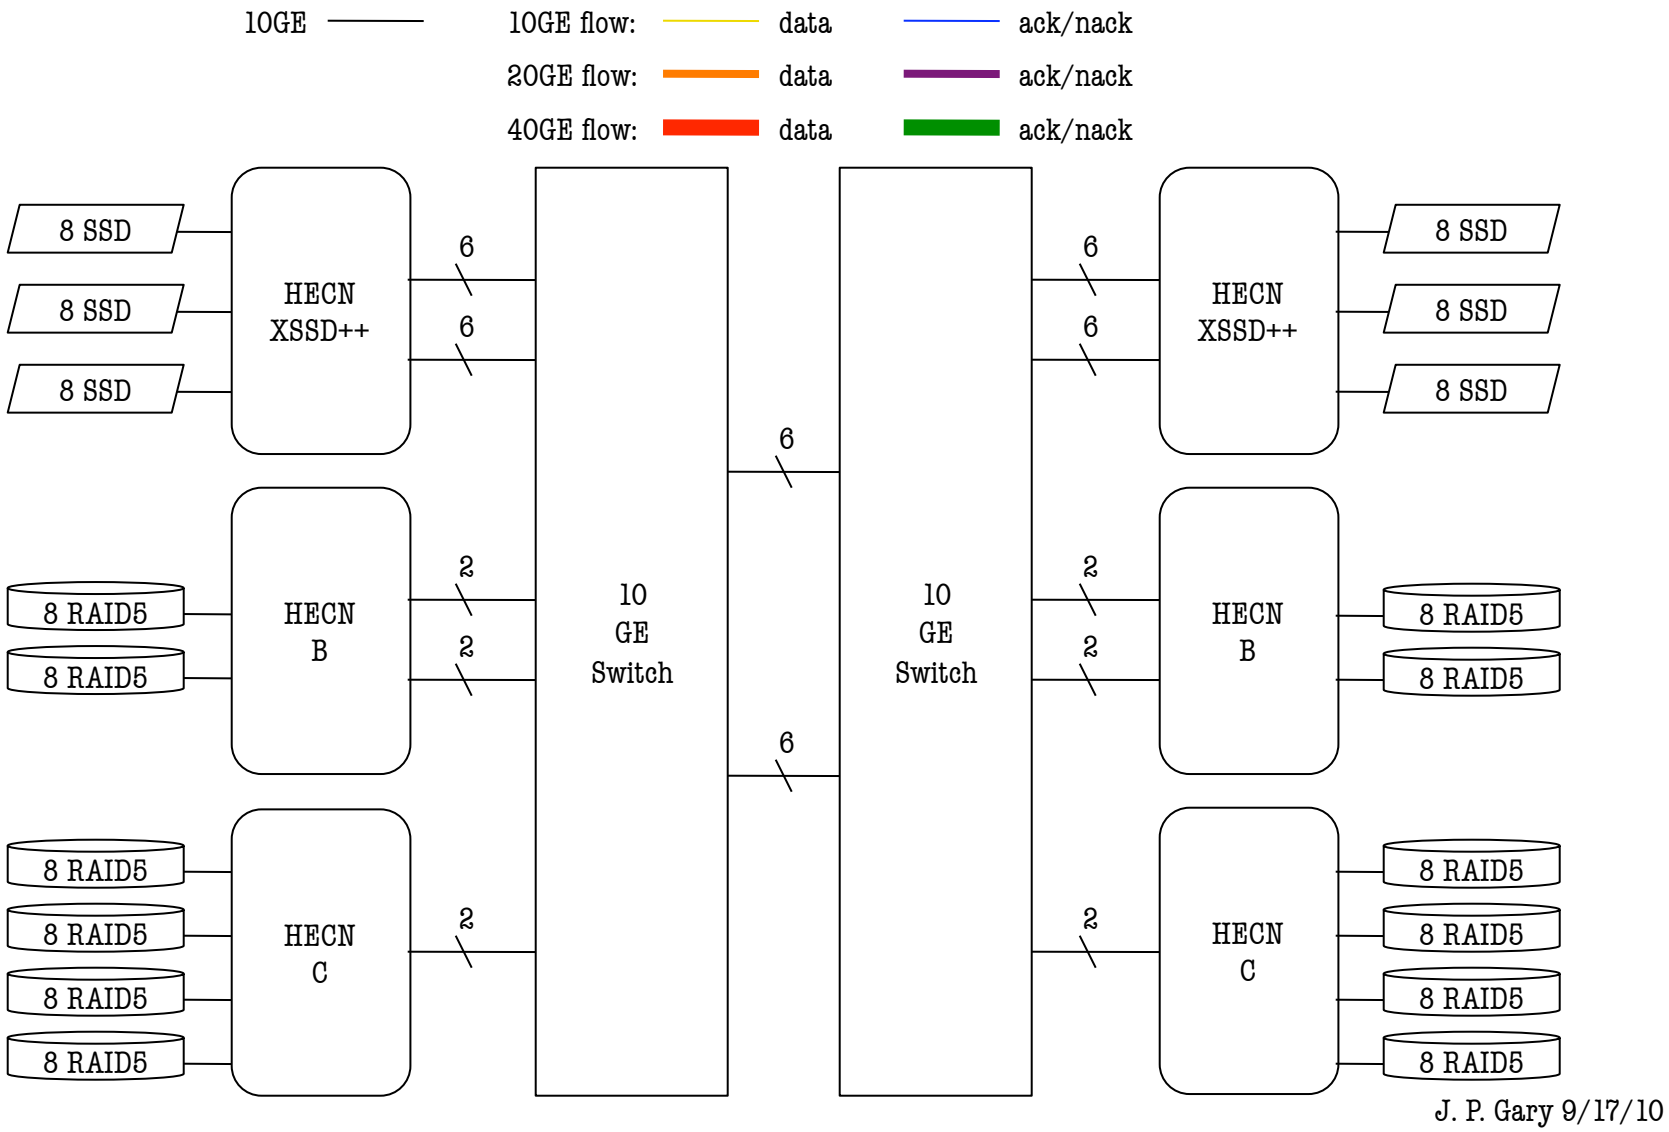
Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC10

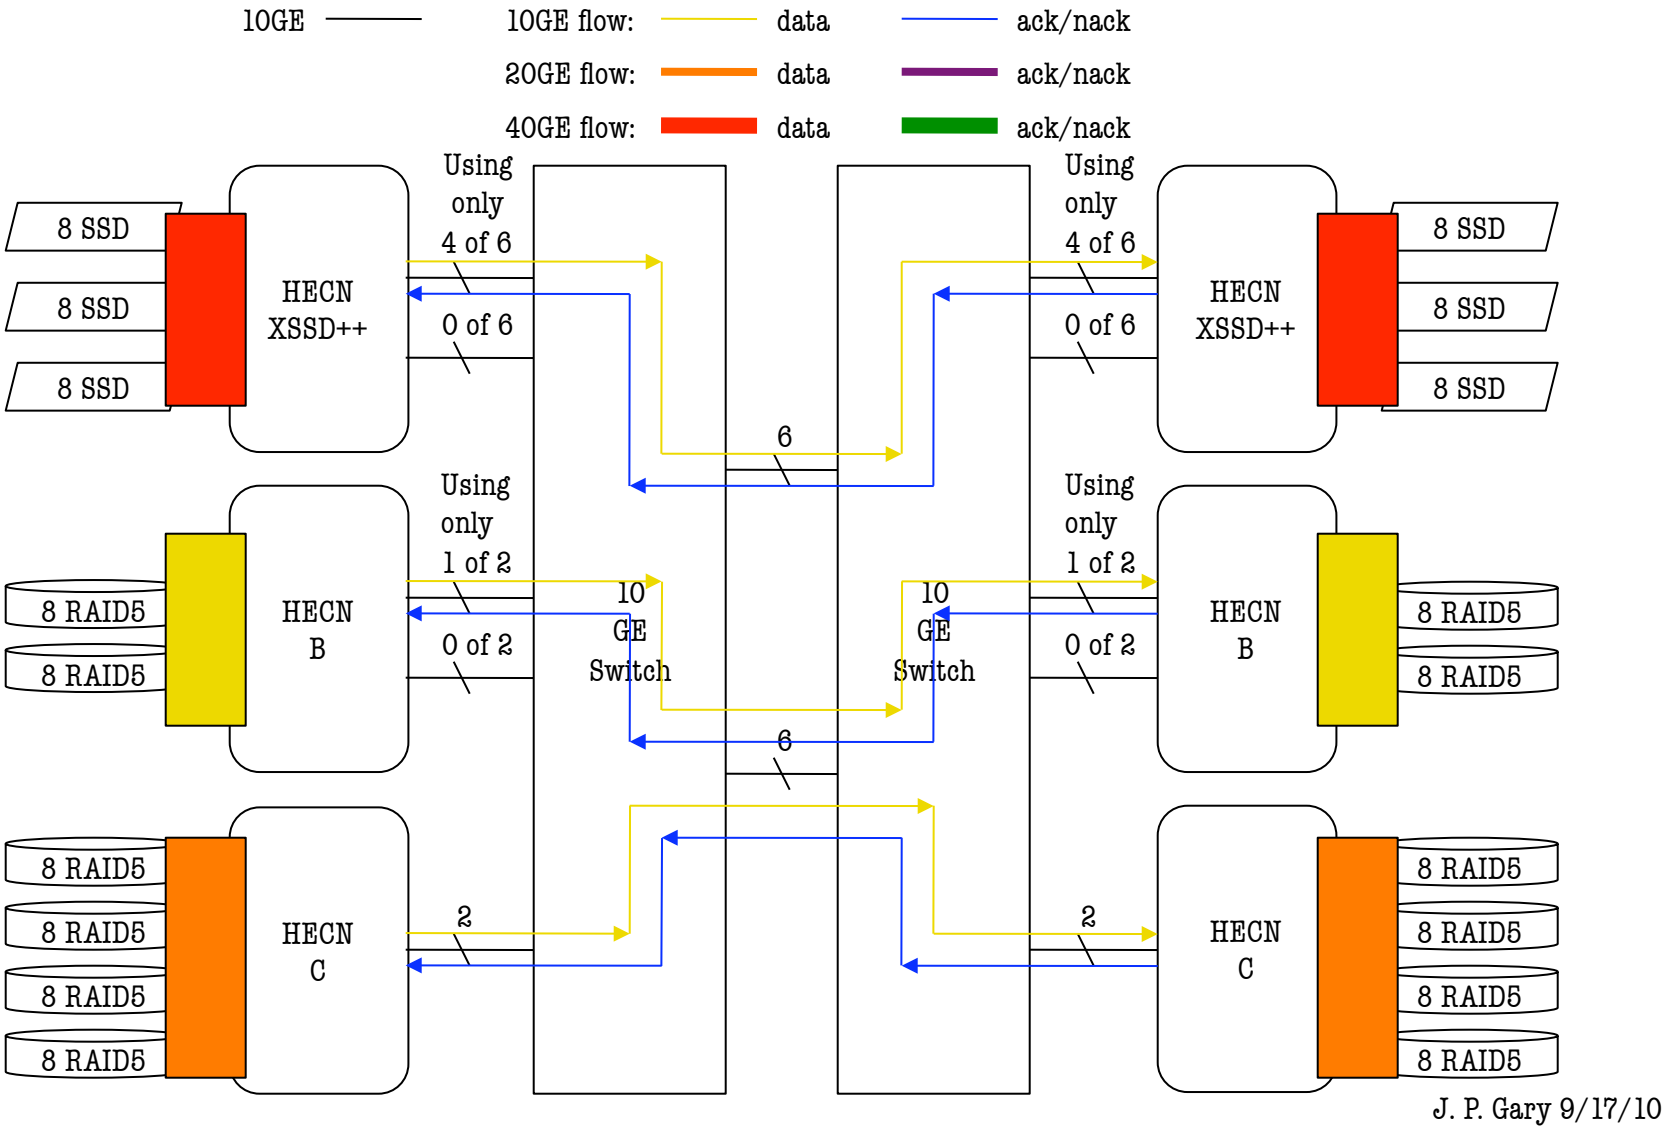
Nuttscp Near-40 Gbps Uni-Directional Disk-to-Disk Flow Paths

- Limitations in HECN's "B" (quad Core i7) workstations ("first generation") that achieved 10 Gbps disk-to-disk primarily were caused by too few PCIe slots (allowing only two RAID5 controllers with 16 rotating disc) and the "RAID5-cpus" in the controllers
- Limitations in HECN's "C" (quad Core i7) workstations (also "first generation" but using 32 rotating discs) that achieved ~20 Gbps disk-to-disk primarily were caused by too little processing power in the Core i7's
- HECN's "XSSD" (quad Xeon) workstations ("second generation") are targeting ~40 Gbps disk-to-disk with 24 SSDs

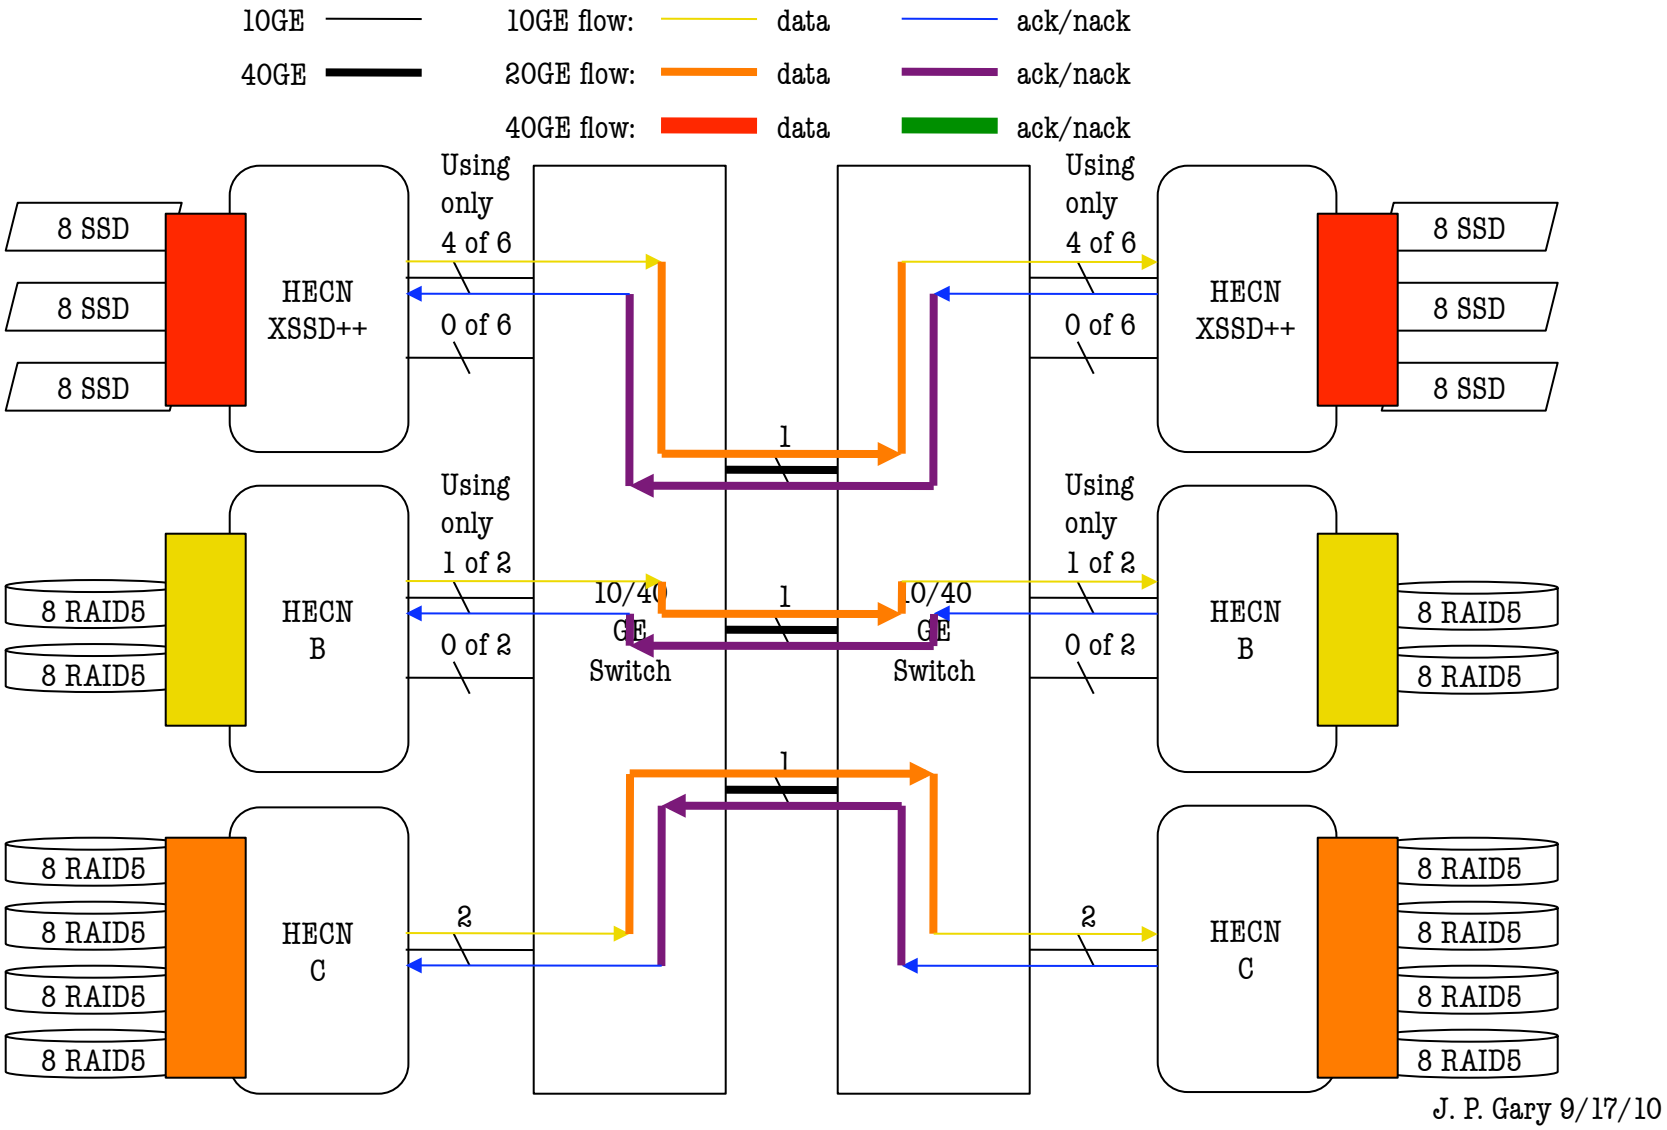
Nuttscp Near-40 Gbps Uni-Directional Disk-to-Disk Flow Paths (1 of 4)



Nuttscp Near-40 Gbps Uni-Directional Disk-to-Disk Flow Paths (2 of 4)



Nuttscp Near-40 Gbps Uni-Directional Disk-to-Disk Flow Paths (3 of 4)



Nuttscp Near-40 Gbps Uni-Directional Disk-to-Disk Flow Paths (4 of 4)

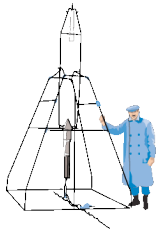
Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Nuttcp (pronounced as new-t-t-c-p or nut-t-c-p)

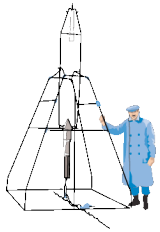
- Primary author Bill Fink (william.e.fink@nasa.gov), with Rob Scott (rob@hpcmo.hpc.mil).
- Great follow-on to original ttcp network throughput performance measurement and troubleshooting tool. Highly recommended. One of the best!
- Over 60 examples of use included in Phil Dykstra's noteworthy tutorial for High Performance Data Transfer (at SC0x's).
- Advanced capabilities/features/options still being added to enable more sophisticated use, while retaining ease-of-use defaults.
- At http://www.nuttcp.net & included in perfSONAR's liveCD.



Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Phase 1 Network-Test Workstation Functional Objectives with Performance Targets (1 of 2)

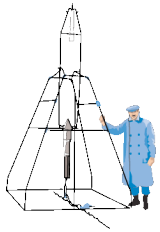
- "B" (Baseline) systems:
  - Primarily for network throughput evaluations via nuttcp memory-to-memory testing at up to 40-Gbps unidirectional, 40-Gbps bidirectional (80-Gbps "total")
  - Secondarily for WAN file copying application throughput evaluations in disk-to-disk testing at up to 10-Gbps unidirectional
- "C" systems:
  - Primarily for WAN file copying application throughput evaluations in disk-to-disk testing at up to 20-Gbps unidirectional
- "A" systems:
  - Primarily for WAN delay emulation at up to 40-Gbps unidirectional, 40-Gbps bidirectional (80-Gbps "total")
  - Also as firewall at up to 20-Gbps unidirectional, 20-Gbps bidirectional (40-Gbps "total")



Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Phase 1 Network-Test Workstation Functional Objectives with Performance Targets (2 of 2)

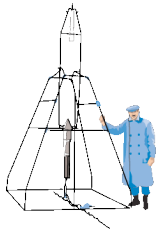
- "A+" systems:
  - Primarily for network throughput evaluations via nuttcp memory-to-memory testing at up to 70-Gbps unidirectional, 40-Gbps bidirectional (80-Gbps "total")
    - Actual performance: On 12Jun09 using eight streams between two A+ systems connected via eight 10GE's, measured an aggregate performance of 69.2907 Gbps unidirectional, and bidirectional 38.6955 Gbps transmit & 38.5842 Gbps receive (77.2797 Gbps total aggregate)
- "A-" systems:
  - Primarily for network throughput evaluations via nuttcp memory-to-memory testing at up to 20-Gbps unidirectional, 20-Gbps bidirectional (40-Gbps "total")



Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Phase 1.1 Network-Test Workstation Functional Objectives with Performance Targets

- "X++" systems:
  - Primarily for network throughput evaluations via nuttcp memory-to-memory testing at up to 100-Gbps unidirectional, 50-Gbps bidirectional (100-Gbps "total")
- Actual performance "in-progress"
  - On 6Aug09 measured an aggregate performance of 100.4637 Gbps in transmits; but currently only up to 56.4703 Gbps in receives
    - Test configuration has each of the two quad-core Xeon processors of one X++ system connected via six 10GE's to one of two quad-core i7-based A+ systems
    - Twelve streams are generated – one for each of the twelve 10GE connections handled by the one X++ system



Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Approximate Costs (With components acquired via SEWP IV in lot-sizes of 3 - 15, and self assembly) of Phase 1 & 1.1 Network-Test Workstations

- "B" System: ~$6.8K
- "C" System: ~$9.0K
- "A" System: ~$4.6K
- "A+" System: ~$6.5K
- "A-" System: ~$3.6K
- "X++" System: ~$11.1K
- For more detail, contact Paul.Lang@nasa.gov

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC09

Nuttscp Sample Test Results Between Two "B-Systems" (1 of 4) [Source: Bill Fink/GSFC]

- Two simultaneous 64-GB file copies (each file-copy streamed between one RAID5 disk controller hosted on each B-system in a LAN testbed)
  - File copy 1: 5092.5196-Mbps 43% TX 77% RX 0 retrans 0.10ms RTT
  - File copy 2: 5045.3832-Mbps 33% TX 77% RX 0 retrans 0.10ms RTT
- One 64-GB file copy (between two RAID5 disk controllers nested as RAID50 hosted on each B-system in a LAN testbed)
  - File copy: 9824.2054-Mbps 58% TX 96% RX 0 retrans 0.10ms RTT
- One 64-GB file copy (between two RAID5 disk controllers nested as RAID50 hosted on each B-system in a 40km MAN testbed)
  - File copy: 9402.0330-Mbps 56% TX 98% RX 0 retrans 0.45ms RTT

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC09

Nuttscp Sample Test Results Between Two "B-Systems" (2 of 4) [Source: Bill Fink/GSFC]

- One 64-GB file copy (between two RAID5 disk controllers nested as RAID50 hosted on each B-system* in a ~3000km-emulated (by netem) WAN testbed)
  - File copy: 9548.0962-Mbps 59% TX 97% RX 0 retrans 80.15ms RTT (completed in 57.58 seconds)
    *With receiver B-system over-clocked to 3.4-Ghz instead of 3.2-Ghz
  - [For comparison a 60.16 second memory-to-memory test using nuttcp: 9661.2217-Mbps 26% TX 40% RX 0 retrans 80.14ms RTT]
- One 64-GB file copy (between two RAID5 disk controllers nested as RAID50 hosted on each B-system** in a ~3000km-emulated (by netem) WAN testbed)
  - File copy: 8931.9535-Mbps 58% TX 97% RX 0 retrans 80.14ms RTT (completed in 61.55 seconds)
    **With receiver B-system clocked normally at 3.2-Ghz

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC09

Nuttscp Sample Test Results Between Two "B-Systems" (3 of 4) [Source: Bill Fink/GSFC]

- One 64-GB file copy (between two RAID5 disk controllers nested as RAID50 hosted on each B-system* in a ~3000km-emulated (by netem) WAN testbed)
  - File copy: 5055.1438-Mbps 31% TX 59% RX 8 retrans 80.15ms RTT (completed in 108.75 seconds)
    *With receiver B-system over-clocked to 3.4-Ghz instead of 3.2-Ghz
  - [For comparison a 30.29 second memory-to-memory test using nuttcp: 5561.7408-Mbps 14% TX 28% RX 4 retrans 80.15ms RTT]
  - Retrans caused by "dropped_bad_crc32" errors at ~10^-6 packet loss rate

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC09

Nuttscp Sample Test Results Between Two "B-Systems" (4 of 4) [Source: Bill Fink/GSFC]

- One 64-GB file copy (between two RAID5 disk controllers nested as RAID50 hosted on each B-system* in a ~3000km real WAN testbed): GSFC→ARC
  - File copy: 7575.1083-Mbps 47% TX 89% RX 0 retrans 80.58ms RTT (completed in 72.57 seconds)
    *With receiver B-system clocked normally at 3.2-Ghz
- One 64-GB file copy (between two RAID5 disk controllers nested as RAID50 hosted on each B-system** in a ~3000km real WAN testbed): ARC→GSFC
  - File copy: 8284.2127-Mbps 60% TX 95% RX 0 retrans 80.58ms RTT (completed in 66.36 seconds)
    **With receiver B-system clocked normally at 3.2-Ghz

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC09

Additional 10-Gbps netem-enabled-WAN Sample Test Results (nuttcp-based) Between Two "B-Systems**"* [Source: Bill Fink/GSFC]

**Also see: *Nuttscp Sample Test Results Between Two "B-Systems" (2 of 4) & (3 of 4)*

***With receiver B-system over-clocked to 3.4-Ghz instead of 3.2-Ghz

- With Large Receive Offload on the myri10ge driver enabled
  - 30 second test using Linux TCP autotuning:
    6053.8558-Mbps 15% TX 24% RX 0 retrans 80.14ms RTT
  - 30 second test using manually specified 100 MB TCP window:
    6796.0992-Mbps 16% TX 27% RX 0 retrans 80.15ms RTT
- With Large Receive Offload on the myri10ge driver disabled
  - 30 second test using Linux TCP autotuning:
    7029.8505-Mbps 19% TX 29% RX 0 retrans 80.15ms RTT
  - 30 second test using manually specified 100 MB TCP window:
    9442.1071-Mbps 27% TX 39% RX 0 retrans 80.15ms RTT

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC09

Sample 4x10-GigE Bonding Test Results (nuttcp-based) Between Two "B-Systems" in Back-to-Back Direct Connection [Source: Bill Fink/GSFC]

- Kernal L2 load-balanced round-robin bonded interface (aka Link Aggregation)
  - 10 second test:
    31615.4616-Mbps 99% TX 95% RX 31 retrans 0.05ms RTT
- Nuttcp "application bonding" using 4 streams (each across its own 10-GigE path)
  - 10 second test:
    39564.4536-Mbps 81% TX 94% RX 0 retrans 0.11ms RTT

In both cases the use of the "correct" CPU made a significant difference in the achieved network performance. Unfortunately the "correct" CPU did not seem to be deterministic.

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC09

More 4x10-GigE Bonding Test Results (nuttcp-based) Between Two "B-Systems"* [Source: Bill Fink/GSFC]

- Nuttcp "application bonding" using 4 streams (each across its own 10-GigE path)
  - 10 second test:
    39134.0831-Mbps 99% TX 91% RX 1 = 0+0+1+0 retrans 0.11ms RTT
  - 10 second test:
    39151.9019-Mbps 91% TX 92% RX 1 = 0+0+1+0 retrans 0.11ms RTT
  - 10 second test:
    39318.0384-Mbps 80% TX 90% RX 1 = 0+0+1+0 retrans 0.10ms RTT
  - 10 second test:
    39406.0384-Mbps 79% TX 92% RX 1 = 0+0+1+0 retrans 0.10ms RTT

*Obtained while testing nuttcp-7.1.1's new features for:

- Improved multilink aggregation specification options (e.g., stride & dotted quad)
- Providing summary TCP retrans info for multi-stream TCP (with per-stream info for Linux)
- Allowing local name resolution to occur for third party nuttcp tests if the remote third party host can't resolve the specified test hostname

Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Precursor Tests of "C-Systems" (to show the individual components have the necessary muscle) [Source: Bill Fink/GSFC]

- Disk I/O speeds via dd reads (of=/dev/null) & writes (if=/dev/zero)
  - Read: 68719476736 bytes (69 GB) copied, 25.8791 s, 2.7 GB/s
  - Write: 68719476736 bytes (69 GB) copied, 26.8676 s, 2.6 GB/s

- 2x10-GigE via "nuttcp application bonding"
  - TX: 19805.8537 Mbps 34 %TX 59 %RX 0 retrans 0.11 msRTT
  - RX: 19808.7300 Mbps 39 %TX 53 %RX 0 retrans 0.11 msRTT

Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Nuttscp Sample Test Results Between Two "C-Systems" (1-of-7) [Source: Bill Fink/GSFC]

- One 64-GB file copy (between four RAID5 disk controllers nested as RAID50 hosted on each C-system in a LAN testbed)
  - Configuration settings:
    - LRO enabled
    - eth2,3 interrupts on CPU0
    - nuttcp application running on CPU1
    - 4xHPT RAID5 interrupts running on CPU2
    - md RAID50 across above
  - Get: 10273.4125 Mbps 52 %TX 99 %RX 0 retrans 0.11 msRTT
  - Put: 10311.2700 Mbps 52 %TX 99 %RX 0 retrans 0.11 msRTT
- Houston, we have a problem! We're definitely not firing on all cylinders. It's obvious what the problem is, namely that the receiver CPU is totally saturated. To go faster is going to require nuttcp using multiple cores in parallel….

Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

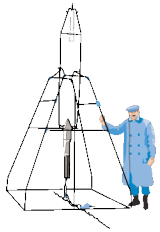
Nuttscp Sample Test Results Between Two "C-Systems" (2-of-7) [Source: Bill Fink/GSFC]

- One 64-GB file copy similar to "1-of-7" but only one side's RAID50 is real
  - Configuration settings: same as in "1-of-7"
  - Get from RAID50 to /dev/null:
    17324.4416 Mbps 98 %TX 49 %RX 0 retrans 0.11 msRTT
  - Put from /dev/zero to RAID50:
    10129.7218 Mbps 27 %TX 99 %RX 0 retrans 0.11 msRTT
- So, the immediate 20-Gbps challenge is primarily on the write side….

Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Nuttscp Sample Test Results Between Two "C-Systems" (3-of-7) [Source: Bill Fink/GSFC]

- Two 64-GB file copy (between four RAID5 disk controllers nested as RAID50 hosted on each C-system in a LAN testbed)
  - Configuration settings: same as in "1-of-7" **plus**
    - nuttcp application running on CPU3
  - Put file1:
    7184.8745 Mbps 41 %TX 71 %RX 0 retrans 0.11 msRTT
  - Put file2:
    7082.7940 Mbps 46 %TX 70 %RX 0 retrans 0.11 msRTT
  - Aggregate throughput:
    14267.6685 Mbps
- Better; but there was a lot of disk head contention seeking back and forth between the two files



Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Nuttscp Sample Test Results Between Two "C-Systems" (4-of-7) [Source: Bill Fink/GSFC]

- A slight variation of "3-of-7", using individual 10-GigE nuttcp streams across individual 10-GigEpaths
  - Put file1:
    7136.7905 Mbps 39 %TX 72 %RX 0 retrans 0.11 msRTT
  - Put file2:
    7123.8836 Mbps 39 %TX 72 %RX 0 retrans 0.11 msRTT
  - Aggregate throughput:
    14260.6741 Mbps
- Basically the same result as "3-of-4"

Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Nuttscp Sample Test Results Between Two "C-Systems" (5-of-7) [Source: Bill Fink/GSFC]

- Splitting the one RAID50 into two separate RAID50s to avoid the disk head seeking contention
  - Configuration settings:
    - LRO enabled
    - eth2,3 interrupts on CPU0
    - nuttcp s2 application running on CPU1
    - 2xHPT RAID5 interrupts running on CPU2
    - first md RAID50 across above
    - 2xHPT RAID5 interrupts running on CPU2
    - second md RAID50 across above
    - nuttcp s1 application running on CPU3
  - Put file1/s1:
    9318.3251 Mbps 55 %TX 92 %RX 0 retrans 0.11 msRTT
  - Put file2/s2:
    7960.6777 Mbps 47 %TX 79 %RX 0 retrans 0.10 msRTT
  - Aggregate throughput:
    17279.0028 Mbps

Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Nuttscp Sample Test Results Between Two "C-Systems" (6-of-7) [Source: Bill Fink/GSFC]

- Similar to "5-of-7" but moving the last 2 HPT RAID5 interrupts to CPU 0, so stream s2could have the same advantage as stream s1
  - Configuration settings:
    - LRO enabled
    - eth2,3 interrupts on CPU0
    - 2xHPT RAID5 interrupts running on CPU0
    - second md RAID50 across above
    - nuttcp s2 application running on CPU1
    - 2xHPT RAID5 interrupts running on CPU2
    - first md RAID50 across above
    - nuttcp s1 application running on CPU3
  - Put file1/s1:
    9161.1181 Mbps 55 %TX 94 %RX 0 retrans 0.11 msRTT
  - Put file2/s2:
    8663.7400 Mbps 52 %TX 89 %RX 0 retrans 0.11 msRTT
  - Aggregate throughput:
    17824.8581 Mbps (90% of maximum 19.8 Gbps)

Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Nuttscp Sample Test Results Between Two "C-Systems" (7-of-7) [Source: Bill Fink/GSFC]

- We are currently investigating SSD technology, to hopefully double our disk transfer speeds and get us into the 40-Gbps networked disk transfer realm

- But using parallelism of multiple cores and multiple streams is going to be key to going to 40-GigE, 100-GigE, and beyond speeds, since individual cores are not getting significantly faster

Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Nuttcp Sample Test Results With One HotLava Systems 6x10GE Tambora 120G6 NIC (1-of-8) [Source: Bill Fink/GSFC]

Configuration of Test Workstations

- Three HECN Team-assembled Intel core i7 server systems (each a 3.2-GHz single-processor (quad core) Intel Core i7 (Nehalem), over-clocked to 3.6 GHz, on an Asus P6T6 WS Revolution motherboard):
  - One using 1 HotLava 6x10-GigE NIC
  - One using 2 Myricom 2x10-GigE NICs
  - One using 1 Myricom 2x10-GigE NIC

Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Nuttcp Sample Test Results With One HotLava Systems 6x10GE Tambora 120G6 NIC (2-of-8) [Source: Bill Fink/GSFC]

- Theoretical maximum throughput (TMT) on a PCI-E 2.0 x16 card is nnn/(nnn+24)*8/10*16*5 Gbps, where:

nnn = PCIe MaxPayload on the test systems
24 = PCIe protocol overhead consisting of:
1 Byte Start of Packet (STP)
2 Bytes Sequence Number
16 Bytes Header (only 12 Bytes if < 4 GB address)
4 Bytes LCRC
1 Byte END
8/10 = 8B10B signalling encoding
16 = number of lanes
5 = 5 Gbps per lane for PCIe 2.0

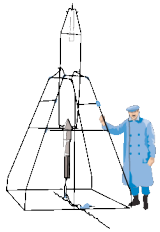
Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Nuttcp Sample Test Results With One HotLava Systems 6x10GE Tambora 120G6 NIC (3-of-8) [Source: Bill Fink/GSFC]

- With MaxPayload defaulted to 128, the TMT = 53.8947 Gbps
- With MaxPayload increased* to 256**, the TMT = 58.5142 Gbps

*Via the setpci command not only on the 6 10-GigE interfaces, but also on all the PCIe bridges and the Intel X58 I/O Hub in the data path, and with the PCIe MaxReadReq increased from 512 to 4096 only on the 6 10-GigE interfaces

**Not 512 because 256 is the maximum value supported by the Intel X58 I/O Hub



Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

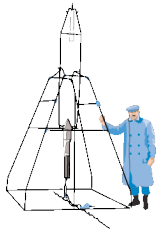
Phase 1 Network-Test Workstations: Nominal "B" System

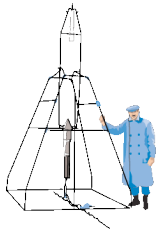
- Chassis: Supermicro 836TQ-R800B (3u 16bay 7slot 800W RPS)
- Motherboard: Asus P6T6 WS Revolution (5 PCIe V2 x8)
- Processors: one Intel i7 965 (3.2GHz quad-core Nehalem)
- Memory: Kingston KHX16000D3ULT1K3 (6GB 2000MHz DDR3 CL8)
- System disks: one Western Digital WD2500BEKT (2.5" 250GB)
- NICs: two Myricom 10G-PCIE2-8B2-2S+E (Dual 10GE SFP+)
- Raid controllers: two HighPoint RocketRaid 4320 (internal, 8 disks each)
- User disks: 16 Western Digital WD5001AALS (500GB)
- IB HCA: one Qlogic QLE7280 (DDR, 8x)
- For more detail, contact Paul.Lang@nasa.gov



Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Phase 1 Network-Test Workstations: Nominal "C" System

- Nominal "B" (Baseline) System
- Minus:
  - NICs: One Myricom 10G-PCIE2-8B2-2S+E (Dual 10GE SFP+)
  - IB HCA: one Voltaire (DDR, 8x)
- Plus:
  - Raid controllers: two HighPoint RocketRaid 4322 (external, 8 disks each)
- Plus via SAS-connection:
  - Chassis: one Supermicro 836TQ-R800B (3u 16bay 7slot 800W RPS) with SAS converter/adaptor and cables
  - User disks: 16 Western Digital WD5001AALS (500GB)
- For more detail, contact Paul.Lang@nasa.gov



Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

Phase 1 Network-Test Workstations: Nominal "A" System

- Nominal "B" (Baseline) System
- Minus:
  - Raid controllers: two HighPoint RocketRaid 4320 (internal, 8 disks each)
  - User disks: 16 Western Digital WD5001AALS (500GB)
  - IB HCA: one Voltaire (DDR, 8x)

"X++" Server Approximate Costs *(With components acquired via SEWP IV in lot-sizes of 3 - 15, and self assembly. Source: Paul Lang (ADNET))*

• Supermicro 836TQ-R800B 3u 16bay 800W RPS Chassis	$850
• Supermicro X8DAH+-F motherborad	$508
• Intel W5580 XEON 3.2GHz processor $1669 x 2	$3338
• Kingston KHX2000C8D3T1K3 6GB DDR3 2000 CL8 memory x 2	$500
• CBL-0084 front pannel cable	$3
• 12" 3pin fan extension cable	$1
• ArkTech slim IDE DVD to SATA adapter	$10
• Myri 10G-PCIE2-8B2-2S+E Dual SFP+ NIC $950 x 6	$5700
• Dynatron G666 CPU cooler	$35
• Western Digital WD2500BEKT 250GB 2.5" system disk	$73
• Red Greatland 18" Slimline SATA adapter	$6
• Supermicro MCP-220-83601-0B FDD tray for 2.5" disk	$8
• eVGA GeForce 8400GS video card	$40
• 8" 8pin power extension cable	$8
	$11080

Introduction To GSFC High End Computing 20, 40 &100 Gbps Network Testbeds

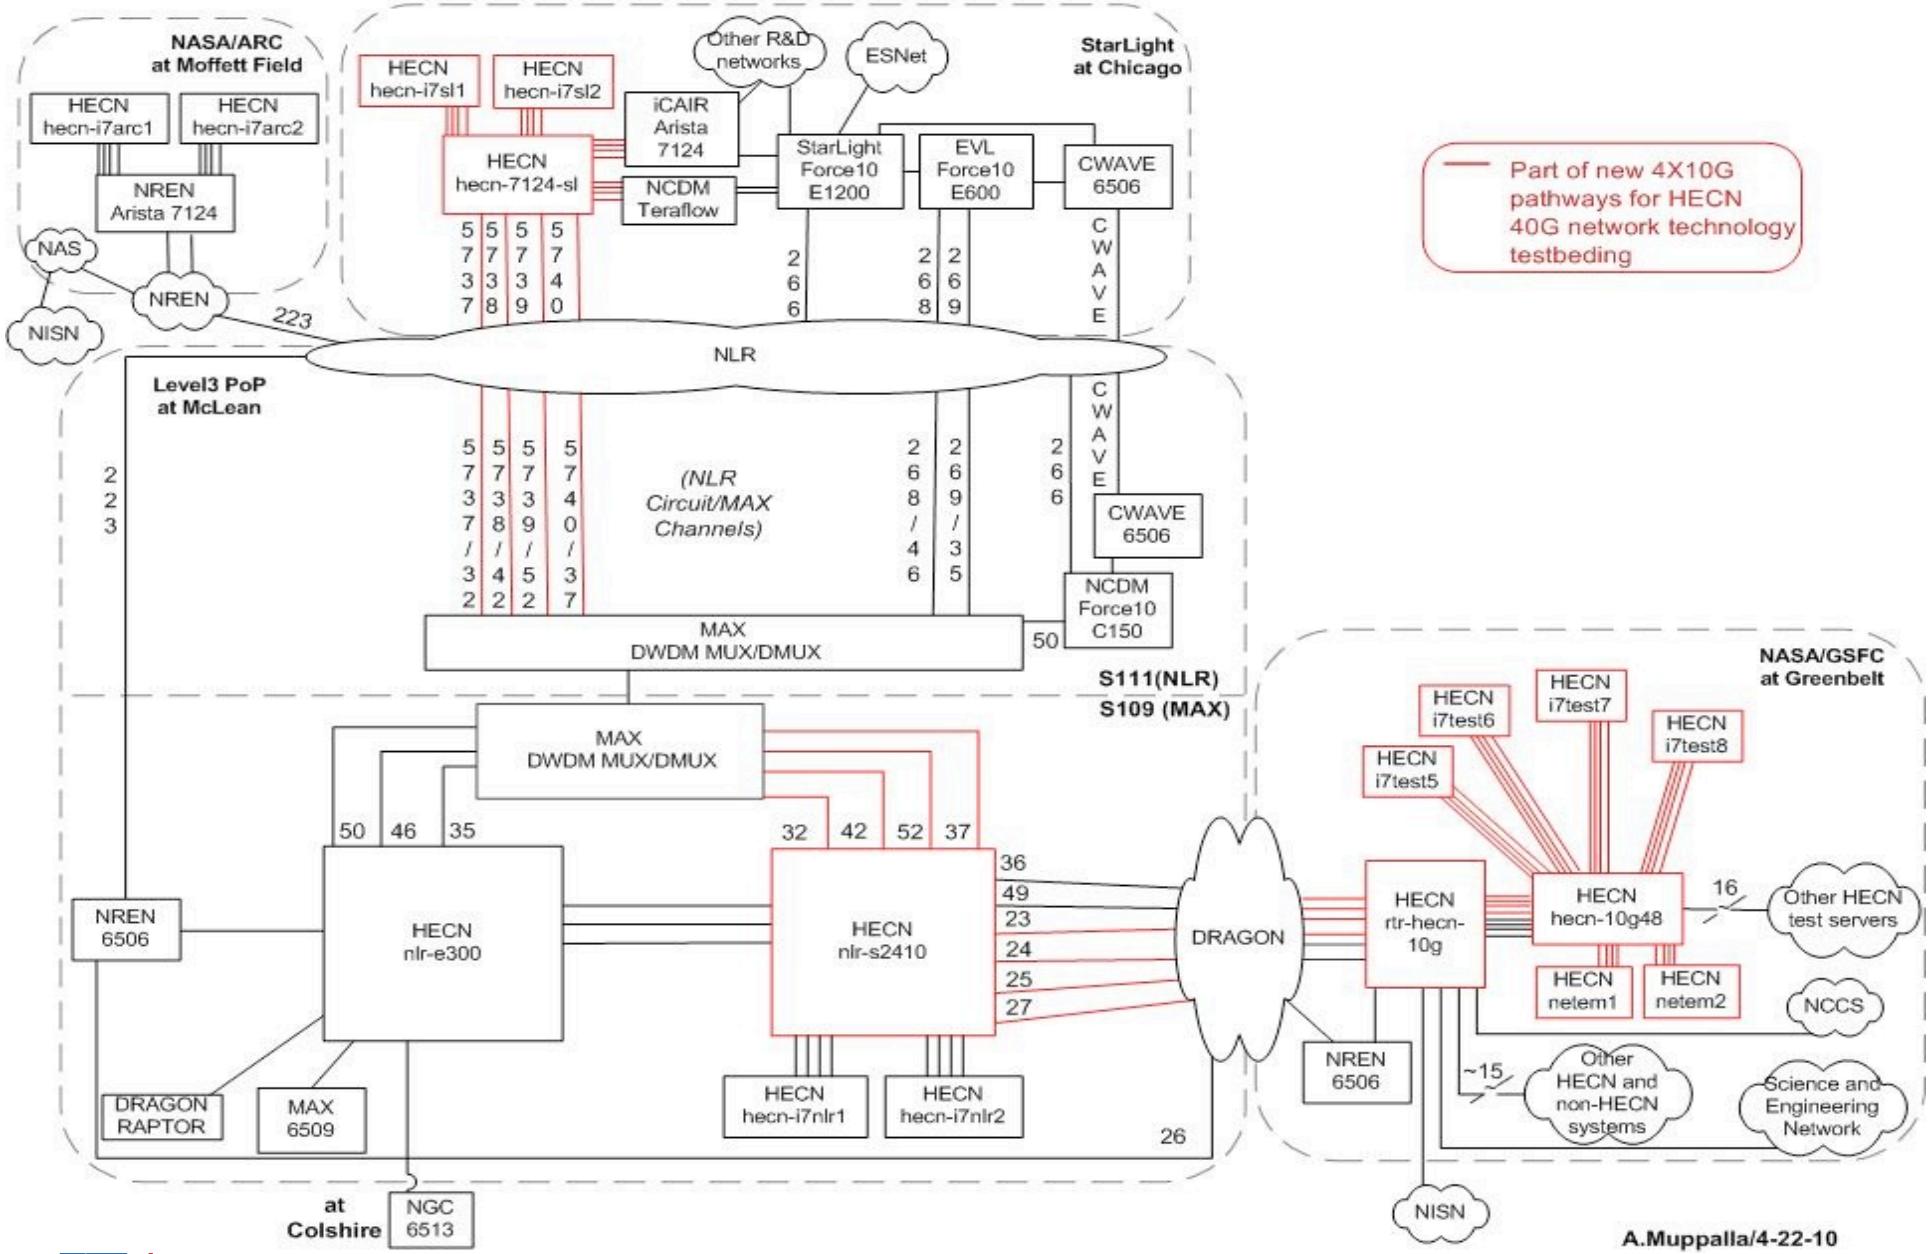
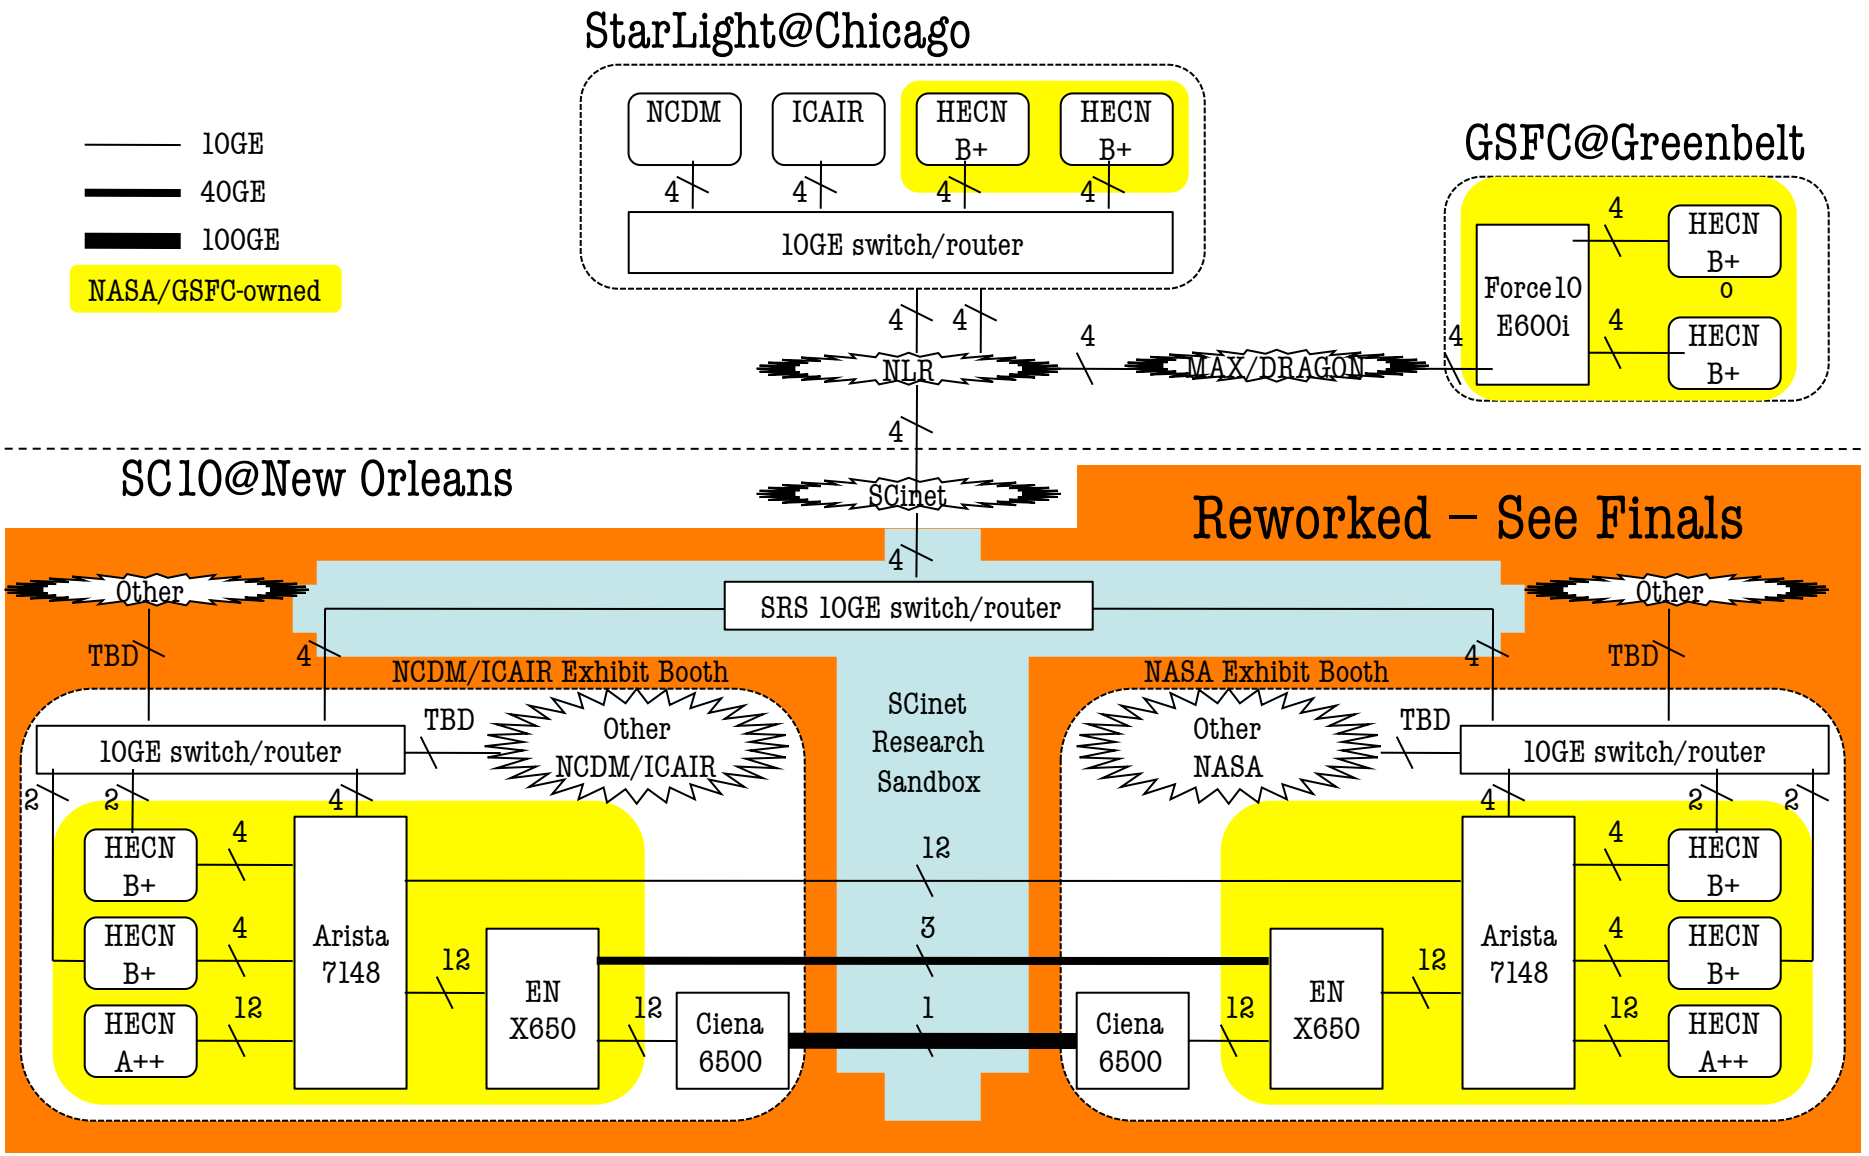
GSFC/High End Computer Network (HECN) and Partners 10GE and 10G Lambda Connections Through McLean

Note: The non-GSFC/HECN systems shown typically have other connections that are not shown in this diagram, as the focus is primarily GSFC/HECN connections



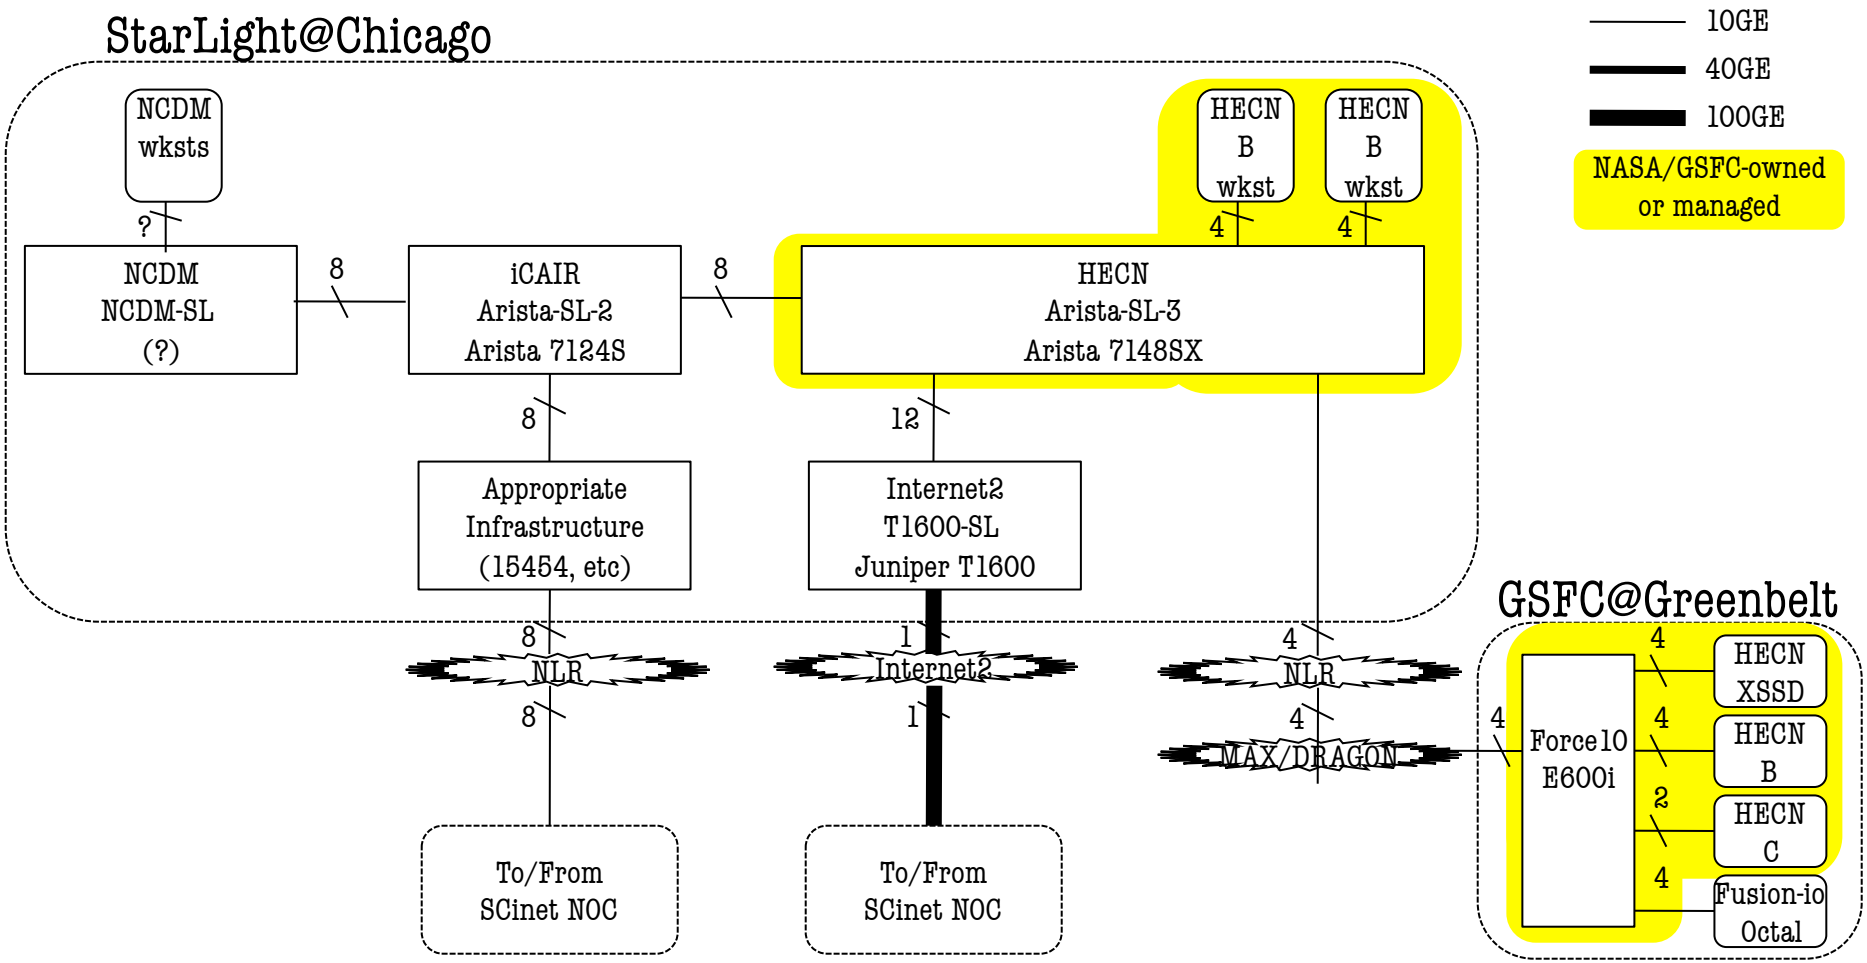
Using 100G Network Technology in Support of Petascale Science

A Collaborative Initiative Among NASA, NLR, Northwestern/iCAIR, SCinet & UIC/LAC



Candidate Configuration at StarLight During SC10 to Additionally Use Internet2's Planned 100G Network Pathway

Note: Not shown are other components of StarLight, Scinet, and Internet2's SC2010 Multi-Vendor 100G Demonstration



J. P. Gary 10/09/10

Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC10

Note Regarding the Special SC10 Demonstration/ Evaluation Experiments

- The following two configurations are planned merely as interim, pre-full-connection steps
- The following third configuration/data flow path is considered merely as an option in lieu of the planned “default” data flow path

Using 100G Network Technology in Support of Petascale Science
